Kiærs Building Models Nr. 1

This model sheet contains the beginning steps of the building of ideal Anchor-building stones; by use in the children's gardens it is with the card-board and is used as a model of the lowest step of building.

Children like to build and do it with a special endurance at the coloured models, they also soon learn to know the meaning of the printed sections when these only are declared to them in the right way. For this purpose, first of all, place the lowest layer of stones of the figure 14 after the drawing of the cross-section a-b, below and give the child the opportunity of comparing both to each other. After that you place the other layer of stones above showing the section c-d (14) to the child. The letters you see beside the sections are also on the drawings of the buildings in order to indicate the position of the sections.

The cross-sections steadily indicate the stones which on the figure lie under the section-line, indicated by letters; only the black hatched stones overhang the section line as the section a-b of the figure 15 distinctly shows; you find on this figure the part of the section line that goes through the two yellow and two blue stones, indicated by points. In similar way it is with the figure 22.

In children's gardens the teachers usually build up first the single figures for the children that they more easily will be able to build the same. However, we will recommend very much not only to do this, but at the same time, when the children have build figure nicely to show and declare to them the particular drawing on the model sheet whereas they by this quickly learn to understand the model of the building. This is especially necessary when it turns upon figures to which belong cross sections.

The sections are best declared by placing the particular layer with the stones. When this is done the children will soon be able without any help to build after the building models. There is hardly any other play which at such a low price gives the children so much entertainment and information than an Anchor stone building-case.

Anchor stone building-cases are goods of high educational meaning and we therefor recommend to continue buying the following cases.

In order not to obtain any worthless substitute, always by the purchase look for the trade mark: an anchor and the name of the firm:

„Sct. Knuds Gaard“, Odense, Denmark.

Byggefornilleder Nr. 1

Dette Fornilledeblad indeholder Begyndelsesgrundene for Byggeriet med de ideelle Anker-Byggestene; ved Brug i Børnehaver opklæbes det paa Pap, og tjener da som Fornillede for det nederste Byggetrin.

Børnene bygger meget gerne og med sjælden Udholdenhed efter de farvede Fornillede, de lærer ogsaa meget snart at kende Betydningen af de hstrykte Tværsnit, naar disse blot fra først af bliver dem rigtigt forklaret. Til dette Øjemed lægger man først og fremmest det underste Stenlag af Figuren 14 efter Tværsnittegningen a-b, forneden, og giver Barnet Lejlighed til at sammenligne begge med hinanden. Derefter lægger man det andet Stenlag ovenpaa og viser Barnet Snittet c-d (14). De Bogstaver, man ser ved Siden af Snittene, befinder sig ogsaa hos Tegningerne af Bygningerne for derved at antyde Snittenes Lejligheden.

Tværsnittene anskueliggør steds de Sten, som paa Figuren ligger under den ved Bogstaver antydede Snitlinie; kun de sort skraverede Stene riger ud over Snitlinien, saaledes som Snittet a-b til Figur 15 tydeligt viser; man finder paa denne Figur den Del af Snitlinien, der gaar igennem de to gule og to blaa Stene, antydet ved Punkter. Paa lignende Maade forholder det sig med Figur 22.
